ABSTRACT

A method for estimating the resemblance of various objects comprises the step of recording (40) data of a real object using a communication device. Furthermore the following steps are included: transferring (41) said recorded data to a service server, extracting (42) a comparison object from said recorded data, making (43) a resemblance analysis between the comparison object and a previously stored object, and transferring (44) result data containing information about the resemblance analysis to a result unit.
